1 PRINCIPLES

Variotherm SystemWall and EasyFlexWall is a source of well-being. It provides heating through horizontal radiant heat instead of the ascending warm air provided by conventional heating systems. This avoids the permanent movement of air and the associated stirring up of dust. Rooms are evenly heated without different temperature zones in the heated rooms.

By the way, solar heat is also radiant heat.

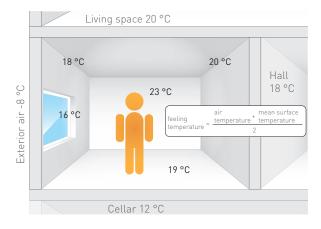

1.1 Comfort

Comfort is not only created through a certain air temperature in the room. The temperature of the surfaces enclosing the room is of equal importance. The felt temperature is roughly consistent with the arithmetic mean of both temperatures.

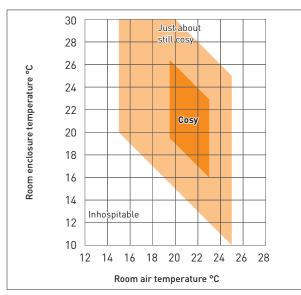

What makes people feel comfortable?

People feel comfortable when the following basic 'thermal comfort' equation holds:

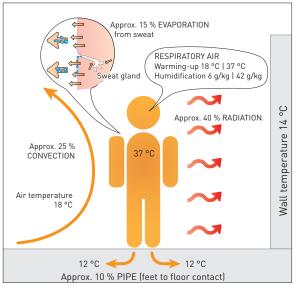

Heat production = heat loss

Impact of the room on felt temperature

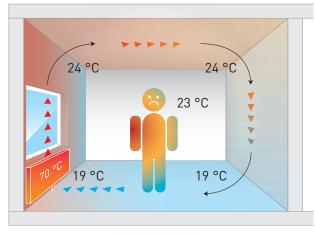

Zone of cosiness

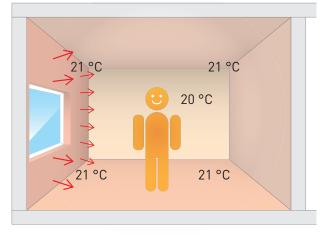

Human heat balance

In this context, it is important that heat loss from the human body is as evenly distributed in all directions as possible. We feel uncomfortable if too much heat is lost in one particular direction (e.g. cold surfaces, draughts) or the heat loss is prevented in one direction (hot surfaces or vapour-tight, thick clothing). The lower the inside air temperature is, the warmer the surrounding surfaces (wall surfaces, floor and ceiling, as well as doors and windows) must be to ensure cosiness.

Compared to other heating systems, the SystemWall and EasyFlexWall installations significantly increases cosiness. The installation of surface heating on an exterior wall, especially under windows, can largely cancel out the unpleasant effects from the radiation exchange between your body and cold exterior walls and windows. You can set the room temperature lower than you would with convection heating, since radiant heat raises the perceived air temperature.

Discomfort with radiators

Comfort with wall heating

1.2 Energy savings

A lowered room air temperature along with increased cosiness significantly minimises energy losses. The approximate heating cost savings per 1 °C lower room air temperature are 6 %. The low room air temperature has the additional great physiological advantage of significantly increasing the absorption of oxygen in the body. The wall heating system is ideal for use with low-temperature energy sources such as condensing boilers, heat pumps and solar collectors because it operates with low surface and heating medium temperatures. With Variotherm wall heating you can achieve energy savings of up to 30 % compared to conventional heating systems.

1.3 Adapts to suit your home

The Variotherm wall heating utilises the existing or intended exterior wall, either as an additional storage medium (if full exterior insulation is present) or as insulation. The wall heating surfaces can be individually adapted to suit the local situation (windows, doors etc.). Visible radiators under the windows are a thing of the past.

1.4 Cooling

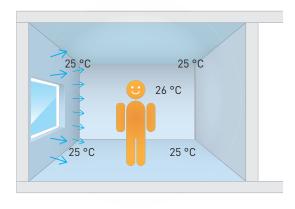

One reason for the frequent lack of satisfaction with air-conditioning systems is the inadequacy of the thermal ambient conditions in the air-conditioned rooms. Most frequently mentioned is the presence of uncomfortable forced air. Cooling via wall surfaces offers the advantage of gentle radiation exchange between the cooled wall surface and the human body. In addition, the room temperature is reduced to a comfortable level.

Effects of surface cooling on the room

When a wall surface is cooled, all warmer objects in the room (floor, interior walls, persons, equipment, etc.) radiate heat into this cooled surface. This loss of heat through radiation leads to a reduction in the surface temperature of these objects, thus providing a cooling effect. The ambient air in the room is also cooled to a comfortable level.

<u>Cooling mode</u>

Based on experience, cooling makes sense at a room temperature ≥ 26 °C. To achieve a noticeable effect and suitably cool the body, a reduction of the ceiling surface temperature to approx. 19–22 °C is possible.

▲ Comfort with wall cooling

Economy

The necessary cooling performance can be better distributed with water than with air. The pumping costs for surface cooling systems are usually significantly lower than the costs incurred by using fans. A 100 percent coverage of the cooling load, as per VDI 2078 (calculation of the cooling load for air-conditioned rooms), is possible in buildings designed for low energy consumption with shadowing equipment and low internal loads.

One of the major advantages of ceiling cooling/heating systems is the low additional investment costs. A single system is used for the cooling and heating modes: the same ceiling surface, same piping system and the same heating/cooling distribution manifold with supply lines and circulation pump. The generation of cooling (chiller/ heat pump/cooling from the floor and ground water) is planned in parallel to the heating unit. Many modern heat pumps already allow switching from heating to cooling mode – without major extra costs. Ambient sources of cooling (deep boreholes, ground collectors, wells ...) can also be used – at zero cost.

Combination of displacement ventilation and surface cooling

Surface cooling does not replace an air-conditioning system with regard to dehumidification and ventilation. Displacement ventilation is an air-conditioning system with low air exhaust speeds and laminar flow of the escaping air at the exhaust vents. Low turbulence in the air flow through the room is achieved through the type of ducting in the room, blowing of air at floor level at a slightly subnormal temperature and extraction of the exhaust air at the ceiling level. This type of displacement flow, known as "displacement ventilation" can achieve almost complete freedom from draughts. The combination of ceiling cooling and displacement ventilation allows significantly higher cooling performance to be achieved compared to using only a displacement ventilation system, without exceeding thermally comfortable air speeds. If the supplied air is dehumidified then low ceiling surface temperatures, and thus high radiant cooling performance, can be achieved without the formation of condensation, even on hot and humid days.

1.5 Description and benefits of SystemWall and EasyFlexWall/Ceiling

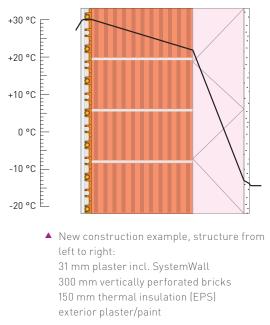

The wall heating/cooling systems under plaster are extremely energy-saving systems for heating and cooling. Variotherm offers two plastered systems: SystemWall and EasyFlexWall, which differ in terms of the plasters and piping dimensions used. EasyFlexWall can be installed 1:1 on the ceiling, thereby also functioning as a pleasant ceiling cooling/heating system \rightarrow EasyFlexCeiling. Depending on the subsurface, the VarioBars are attached to the (outer) wall or ceiling using ScrewFix or nail anchors and the VarioProFile pipe is clamped into the VarioBars, starting from the heating manifold. Separate retaining clamps are provided for fastening the return to the wall. The plaster is applied after installation.

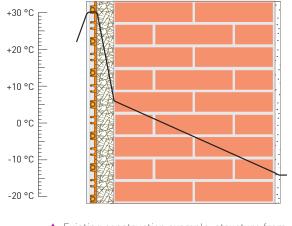

The advantages:

- Proven surface heating/cooling systems for plastered interior finishing
- EasyFlexWall installable 1:1 on ceiling (EasyFlexCeiling)
- Installation without connecting elements in the wall is possible
- Easy to locate using a pipe locator in the case of subsequent fastening
- Heating system: large-surface, extremely energy-saving low temperature system
- Cooling system: silent, no forced air, energy-efficient
- The SystemWall has been awarded the IBO quality seal by the Austrian Institute for Healthy and Ecological Building

1.6 Temperature variations/wall structure

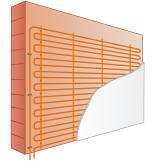

Various different wall fittings at a wall surface temperature of 30 °C and a standard outdoor (air) temperature of –14 °C.

 Existing construction example, structure from left to right:
 31 mm plaster incl. SystemWall
 50 mm wood-wool construction panel
 2 × 250 mm NF bricks
 exterior plaster/paint

2.3 VarioProFile pipe 11.6x1.5 and 16x2 Laser

Advantages

- Fully corrosion-free
- Optimum creep behaviour
- Just as light as a plastic pipe
- 10-year guarantee with certificate
- Profiled surface structure guarantees optimum heat transfer (10 or 15 % larger surface)
- Flexible, easy to bend, extremely stable form
- Resistant to hot water additives (inhibitors, antifreeze)
- Mirror-smooth inner surface less pressure loss no encrustation

10 or 15 % larger

surface

- High pressure and temperature resistance (10 bar, +95 °C)
- 100 % oxygen diffusion-tight
- Low linear coefficient of expansion, low heat expansion forces
- Tested as per EN 21003 (IMA Dresden), SKZ A 397

Elongation

with 10 m and temperature difference Δt 25 °C (e.g. 20 °C to 45 °C):

| | Tubing | Elongation | | |
|----------|--|-------------------------------|---|---|
| ics | PEX/VPE PP | 50.00 mm 42.50 mm | | 0 |
| Plastics | PB PVC | 32.50 mm 20.00 mm | 0 | |
| Metall | VarioProFile pipe Cu Stainless steel | 5.75 mm 4.20 mm 3.50 mm | | The VarioPro elongation ar perfect for su |
| Me | Steel | 2.88 mm | Ð | pipes. |

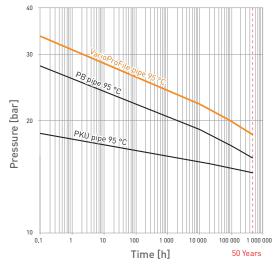

Homogeneous plastic pipes produce high stress levels in the device because of their expansion coefficient.

The VarioProFile pipe combines the minor elongation and thermal expansion. So it is perfect for surface heating- and -cooling pipes.

Technical data

| Pipe diameter: | 11.6 mm | 16 mm |
|--|---|--------------|
| Pipe wall thickness: | 1.5 mm | 2 mm |
| Aluminium pipe thickness: | 0.15 mm | 0.18 mm |

- Raised-temperature-resistance polyethylene (PE-RT) with profiled surface structure
- Adhesive layer
- Homogeneous laser-welded solid aluminium pipe
- Adhesive layer
- Raised-temperature-resistance polyethylene (PE-RT)

2.4 Variotherm EcoHeatingPlaster (for SystemWall – SWHK2)

The Variotherm EcoHeatingPlaster has been developed for use as a **base coat plaster** for the system wall heating/cooling (SWHK2), for a plastering thickness (incl. heating pipe) of up 25 mm. It is a natural construction material, with excellent environmentally-friendly characteristics verified by the IBO quality seal.

Advantages

- Purely organic material
- Permeable to water vapour
- Hygroscopic
- Shock resistant
- Good adhesive properties
- Premixed hydraulic dry mortar. Classification: GP, PM2, W3
- High thermal conductivity about 10–25 % better than "normal" plasters
- Good heat storage properties due to the extremely high oven-dry density of 1500 kg/m³
- Good condensation properties with cooling function
- Smooth application suitable for machine and manual application (e.g. plaster machine G4)
- Guaranteed heat dissipation values for the whole system (SWHK2)

Components

Plaster sand, additives, trass. What is trass? Volcanic tuff prepared in a drying and grinding process. The main components of these "pozzolana" substances are silicic acids (water insoluble) and clay. Apart from water, no other additives need to be added at the construction site. The plaster cures hydraulically. Only air and water are required for curing.

Technical data

| 2 mm |
|--------------------------------------|
| > 3 N/mm² |
| > 1 N/mm² |

| 10 mm |
| 25 mm |
| 25 kg per bag; 42 bags per EU pallet |
| |

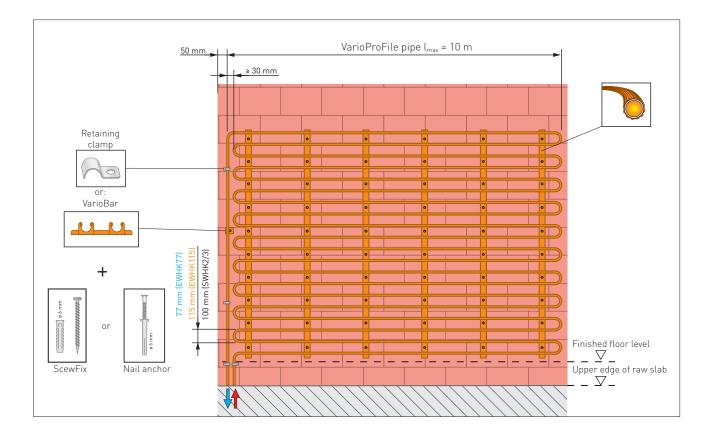

Safety data sheet "EcoHeatingPlaster", available from www.variotherm.com/en/service/info-centre.html

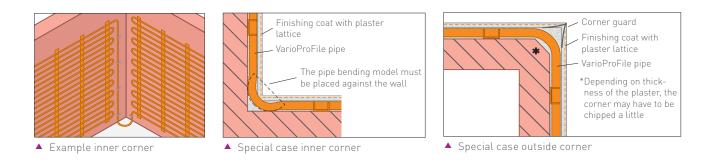

3 PIPING

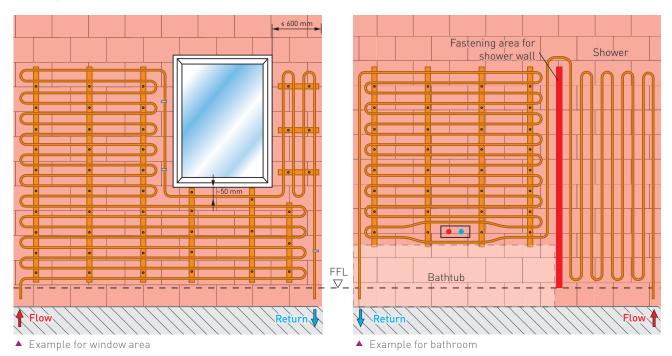

3.1 General

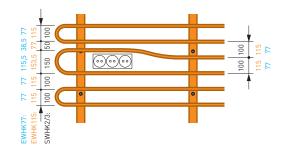

| | SWHK2/3 | EWHK77 | EWHK115 |
|--|---------|----------|----------------------|
| Pipe spacing | 100 mm | 77 mm | 115 mm |
| Dimension VarioProFile pipe | 16x2 | 11.6x1.5 | 11.6x1.5 |
| Pipe requirement per 1 m ² wall heating surface | 10 m/m² | 13 m/m² | 8.7 m/m ² |
| Max. pipe length per heating circuit incl. supply | 120 m | 80 m | 80 m |

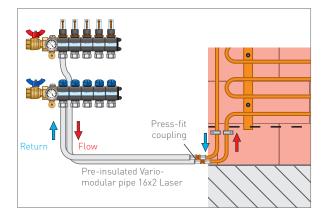

3.2 Pipe installation with assemblies

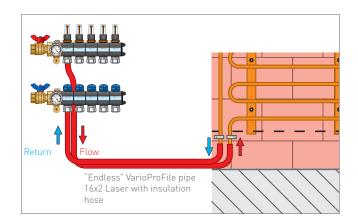

A section-wise smaller/bigger spacing is permissible for assemblies (sockets, windows etc.).

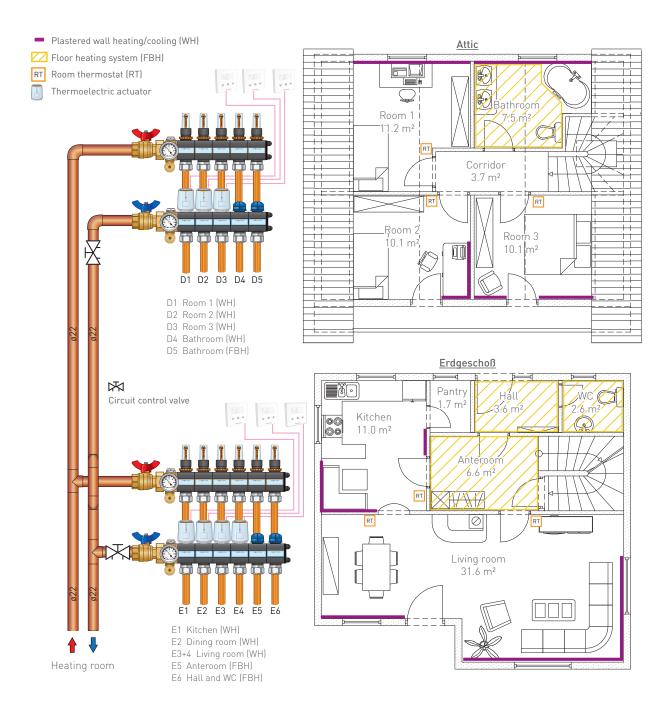

3.3 Supply pipe

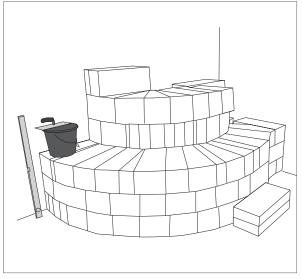

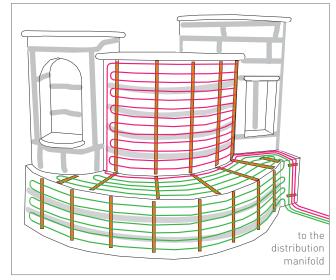

3.4 Single-family house example

In the example provided, the heating system has been adapted to suit the rooms: A floor heating system is planned for tiled rooms (anterooms, toilet, bathroom) and wall heating surfaces are planned for the living rooms, work rooms and bedrooms. A room thermostat for controlling the room temperature is planned for the kitchen, dining area and living room (influence of external heat sources from kitchen appliances, south-facing glass surfaces and tile stoves).

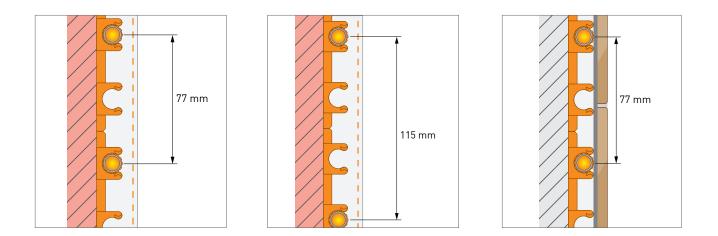

3.5 EasyFlexWall as 'designer heating'

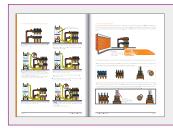

▲ Building a substructure (e.g. with porous concrete)

▲ Installing the VarioProFile pipe

Caution: The plaster must be compatible with the planned flow and surface temperature of the EasyFlexWall in the long term!

<< Details regarding the system and heating circuit pipes and the room temperature control are provided in the DISTRIBUTION and CONTROL planning and installation instructions.

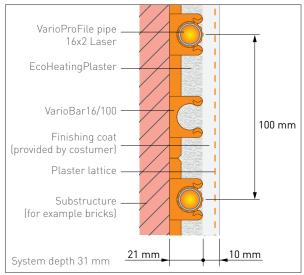

4 PLASTER

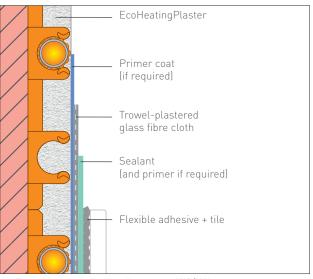

4.1 Plastering with EcoHeatingPlaster (SWHK2)

The Variotherm EcoHeatingPlaster (for details see also chapter 2.4) is used as a **base coat plaster** for the system wall heating/cooling (SWHK2), with plastering thicknesses (incl. heating pipe) of up to 25 mm. It is applied up to the soffit. **Fine plastering** follows on-site with approx. 10 mm pipe covering.

Examples for finishing coat on Variotherm EcoHeatingPlaster:

| | | Oven-dry density (28d) | Com- pressive strength | Product examples | Maximum grain size | Min. drying time EcoHeatingPlaster | Inserted Variotherm plaster lattice | Max. flow temperature |
|---|--------------------------------------|---------------------------|------------------------------|---------------------------------|--------------------------|---------------------------------------|---|--------------------------|
| | Lime plaster, lime cement plaster | ≥1200 kg/m³ | < 3 N/mm² | maxit ip 20, Baumit MPI 30 | Depending on products | 6 to 9 hours (hardening) | Yes | 55 °C |
| - | Lime gypsum plaster | ≥ 1200 kg/m³ | < 3 N/mm² | maxit ip 23 F, Baumit MPI 26 | 1.0 mm | 7 days | Yes | 45 °C |

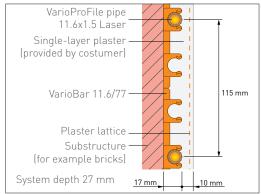

Example for SWHK2

▲ Example for tiles – loading group W3/W4

4.2 Plastering with single-layer plaster (SWHK3, EWHK/EDKH)

- Single-layer plasters require the manufacturer's approval for use with wall/ceiling heating/cooling systems.
- Observe the manufacturer's guidelines for plastering
- Oven-dry density (28d): ≥ 1250 kg/m³
- Pipe covering: ≥ 10 mm
- The plaster must be compatible with the planned flow and surface temperature.

▲ Example EasyFlexWall EWHK115

5 THERMAL/COOLING PERFORMANCE

5.1 Calculation of the heating and cooling load

The EN 12831 standard with the respective national annex applies to the heating load calculations for the heated rooms. Every room is considered individually. For the outside temperature, the locally acquired and standardised outdoor temperature T_{ne} is used.

Variotherm also conducts <u>cooling load calculations</u> (subject to a fee) according to the new VDI 2078 guideline (valid since June 2013). For calculation purposes, precise information must be provided on the building and the rooms to be cooled (U-values with layer composition, shading, internal loads).

▲ Extract from a cooling load calculation

5.2 Variotherm dimensioning software

Key values for individual heating/cooling circuits (the amount of water, pressure loss, number of circuits, allocation of the manifolds etc.) can be quickly and easily calculated by inputting the heating or cooling load into the Variotherm dimensioning software. It can be found in our Professional Area at *www.variotherm.com/profi*.

6 ARRANGEMENT OF THE SURFACES

Wall heating installations are used for heating occupied areas. For this reason, they should be evenly distributed over the interior sides of exterior walls. At normal ceiling heights (up to 3 m) in buildings with good thermal insulation, designing the wall heating/cooling system to a maximum height of 2 m above the finished floor level is sufficient. In special cases (ceiling height > 3 m, e.g. halls, stairwells, therapy areas) the wall heating installations must be designed higher than 2 m.

Experience has shown that the comfort effect is perceived at a distance of up to 5 m from the heated wall. In larger rooms it is therefore advantageous to install wall heating systems on two opposing walls because the radiance effect on the body declines in proportion to the square of the distance.

Estimated values for dimensions:

- ~ 40 % wall surface or 50–60 % ceiling surface of the room area for heating
- ~ 70–80 % wall/ceiling surface of the room area for cooling

Caution: Observe the heating/cooling load calculation for precise dimensioning of the area required!

With a good arrangement of the radiant heating surfaces and U-values (exterior wall) of ≤ 0.3 W/m²K, the room air temperature can be reduced by up to 3 °C while retaining the same perceived temperature (comfort). Seating and glass surfaces (e.g. windows) must be taken into consideration when choosing the arrangement of wall heating surfaces.

Issues relating to furniture:

Since the radiant heat should penetrate into the living area, this is to be taken into consideration in the furniture planning. Wall fittings, full bookcases, built-in cupboards etc. should not be planned in front of wall heating systems. Desks, chests of drawers, open seats, small boxes, kitchen corner banks, pictures etc. usually present no problem. General rule of thumb: maximum of 15 % furnished area.

Alternatively, ceilings are ideal for use as cooling and heating surfaces because the radiant surfaces are not impeded by room furnishings.

Tip: Beds (especially the bedheads) should not be placed directly in the radiation area of wall heating elements.

ENJOY THE COMFORT & SAVE ENERGY

That's why our customers love us: Heating and cooling optimised for COMFORT in all rooms! Fast and friendly service, ANSWERS backed up with expertise! Always in tune with the latest technology, INNOVATION guaranteed! Everything CLEAR and SIMPLE, in writing of course! PROFESSIONALISM at all times, from the first contact to the reference list!
